Supplementary Information

Tree height and leaf drought tolerance traits shape growth responses across droughts in a temperate broadleaf forest

Table S1. Monthly Palmer Drought Severity Index (PDSI), and its rank among all years between 1950 and 2009 (driest=1), for focal droughts.

year	month	PDSI	rank
1966	May	-2.98	2
	June	-3.40	2
	July	-4.08	2
	August	-4.82	1
1977	May	-2.96	3
	June	-3.28	3
	July	-3.61	3
	August	-3.68	3
1999	May	-3.63	1
	June	-4.21	1
	July	-4.53	1
	August	-4.64	2

Table S2. Species-specific regression equations for bark thickness (mm) as a function of diameter at breast height without bark (mm).

Species	Equations	R^2
Carya cordiformis	$ln[r_{bark}] = -1.56 + 0.416 * ln[DBH]$	0.226
Carya glabra	$ln[r_{bark}] = -0.393 + 0.268 * ln[DBH]$	0.04
Carya ovalis	$ln[r_{bark}] = -2.18 + 0.651 * ln[DBH]$	0.389
Carya tomentosa	$ln[r_{bark}] = -0.477 + 0.301 * ln[DBH]$	0.297
Fagus grandifolia	-	-
Fraxinus americana	$ln[r_{bark}] = 0.418 + 0.268 * ln[DBH]$	0.256
Juglans nigra	$ln[r_{bark}] = 0.346 + 0.279 * ln[DBH]$	0.246
Liriodendron tulipifera	$ln[r_{bark}] = -1.14 + 0.463 * ln[DBH]$	0.545
Quercus alba	$ln[r_{bark}] = -2.09 + 0.637 * ln[DBH]$	0.603
Quercus prinus	$ln[r_{bark}] = -1.31 + 0.528 * ln[DBH]$	0.577
Quercus rubra	$ln[r_{bark}] = -0.593 + 0.292 * ln[DBH]$	0.101
Quercus velutina	$ln[r_{bark}] = 0.245 + 0.219 * ln[DBH]$	0.087

We used linear regression on log-transformed data to relate r_{bark} to the diameter inside bark from 2008 data. These were then used to determine r_{bark} in the DBH_Y reconstruction (DBH in year Y). No bark correction was applied for *Fagus grandifolia*, which has thin bark.

Table S3. Species-specific regression equations for height (m) as a function of DBH (cm)

Species	Equations	R^2
Carya cordiformis	ln[H] = 0.332+0.808*ln[DBH]	0.874
Carya glabra	ln[H] = 0.685+0.691*ln[DBH]	0.841
Carya ovalis	ln[H] = 0.533+0.741*ln[DBH]	0.924
Carya tomentosa	ln[H] = 0.726+0.713*ln[DBH]	0.897
Fagus grandifolia	ln[H] = 0.708+0.662*ln[DBH]	0.857
Liriodendron tulipifera	ln[H] = 1.33+0.52*ln[DBH]	0.771
Quercus alba	ln[H] = 0.74+0.645*ln[DBH]	0.719
Quercus prinus	ln[H] = 0.41+0.757*ln[DBH]	0.886
Quercus rubra	ln[H] = 1.00+0.574*ln[DBH]	0.755
all	ln[H] = 0.839+0.642*ln[DBH]	0.857

Table S4. Individual tests of species traits as drivers of drought resistance, where Rt is used as the response variable.

		all droughts		1966		1977		1999	
variable	category	ΔAICc	coefficients	ΔAICc	coefficients	ΔAICc	coefficients	ΔAICc	coefficients

Models are ranked by AICc. Shown are all models whose AICc value falls within 2.0 (ΔAICc<1) of the best model (bold). R^2 refers to conditional R^2. Year was included in the model for all drought years and appeared in all its top models (1966: 0, 1977: -0.099, -0.099, -0.099, -0.097, -0.097; 1999: -0.174, -0.174, -0.174, -0.173, -0.172).

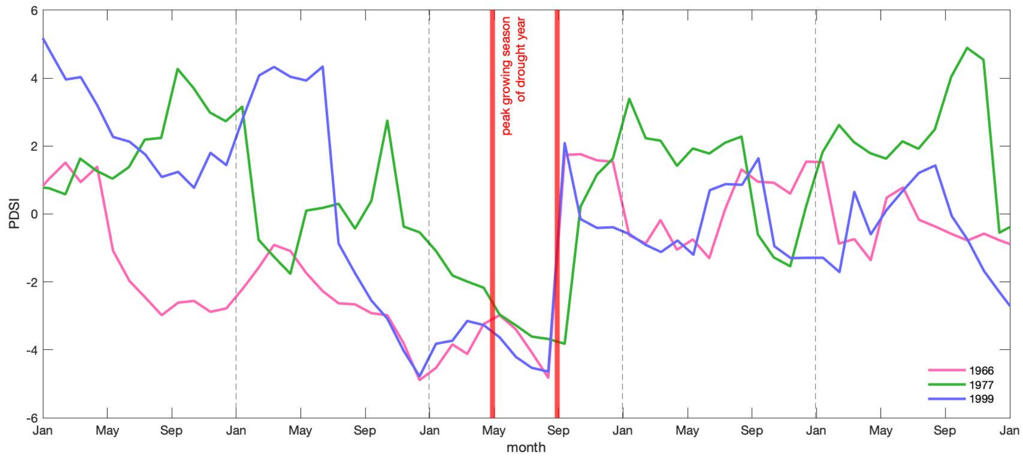

Figure S1. Time series of Palmer Drought Severity Index (PDSI) for each focal drought year ± 2 years

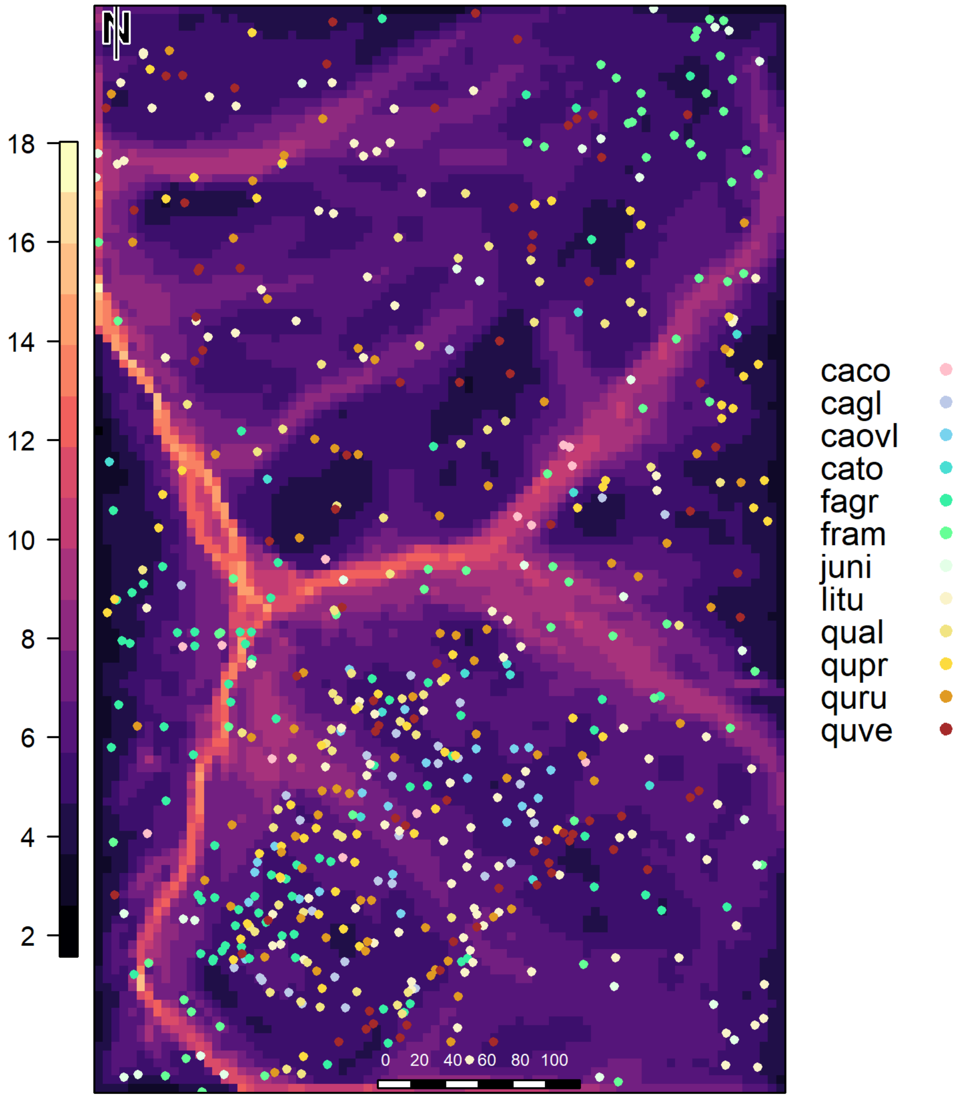

Figure S2. Map of ForestGEO plot showing topographic wetness index (color scale) and location of cored trees. Scale units are in meters

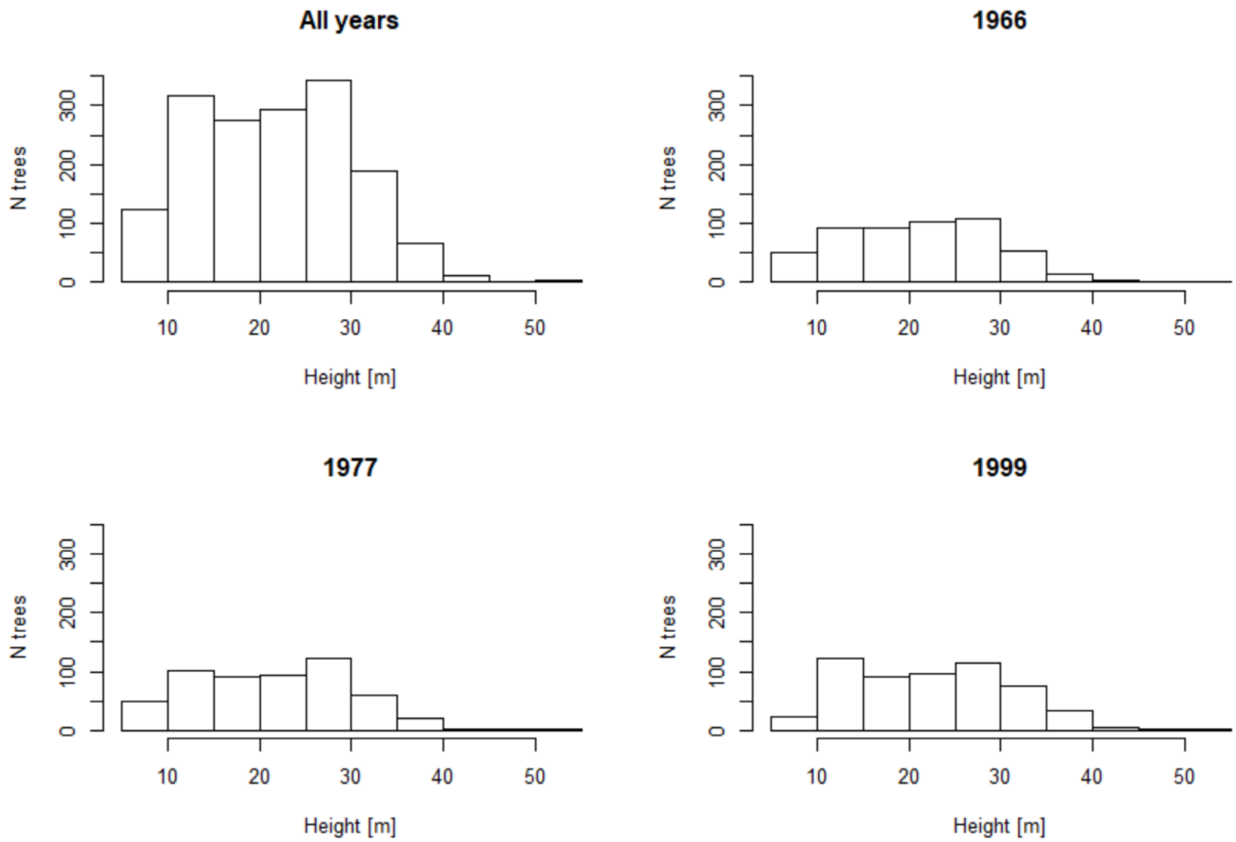

Figure S3. Distribution of reconstructed tree heights across drought years.

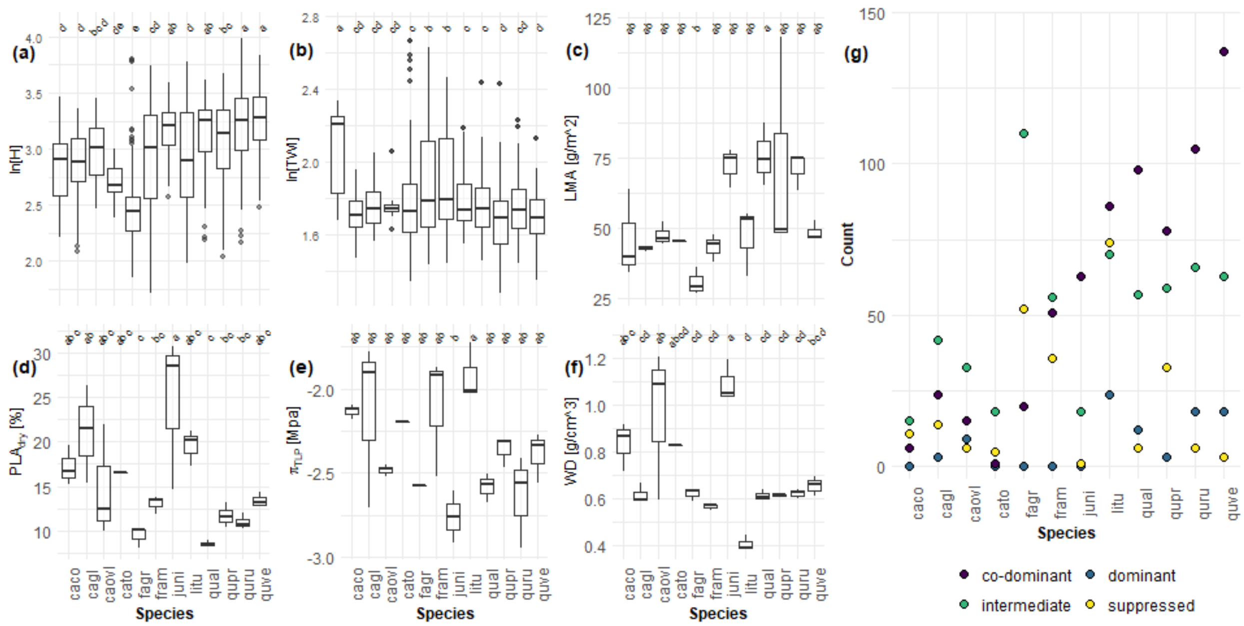

Figure S4. Distribution of independent variables by species. Species that are assigned the same letter are not significantly different from each other with regard to the tested variable. Letter groupings do not transfer between variables.

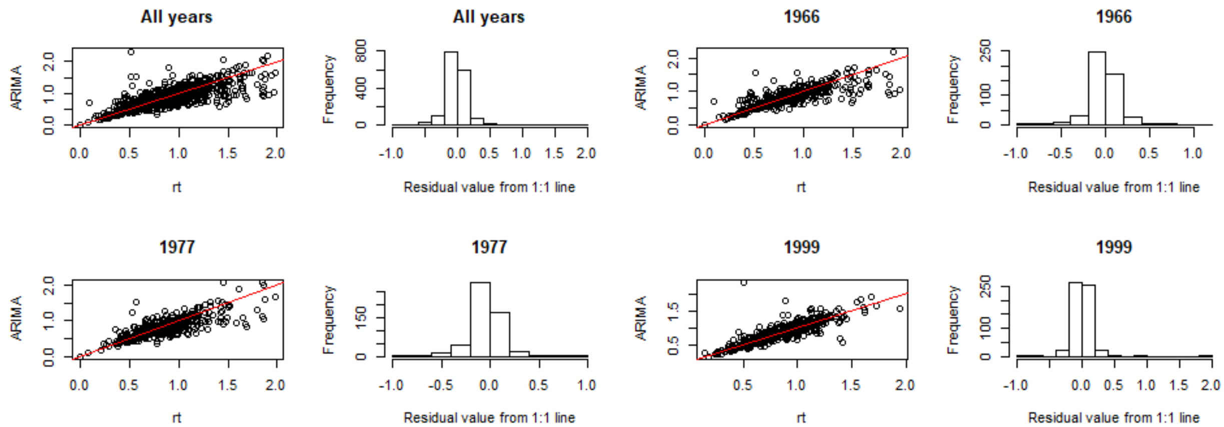

Figure S5. Comparison of Rt and Rt_{ARIMA} results, with residuals, for each drought scenario

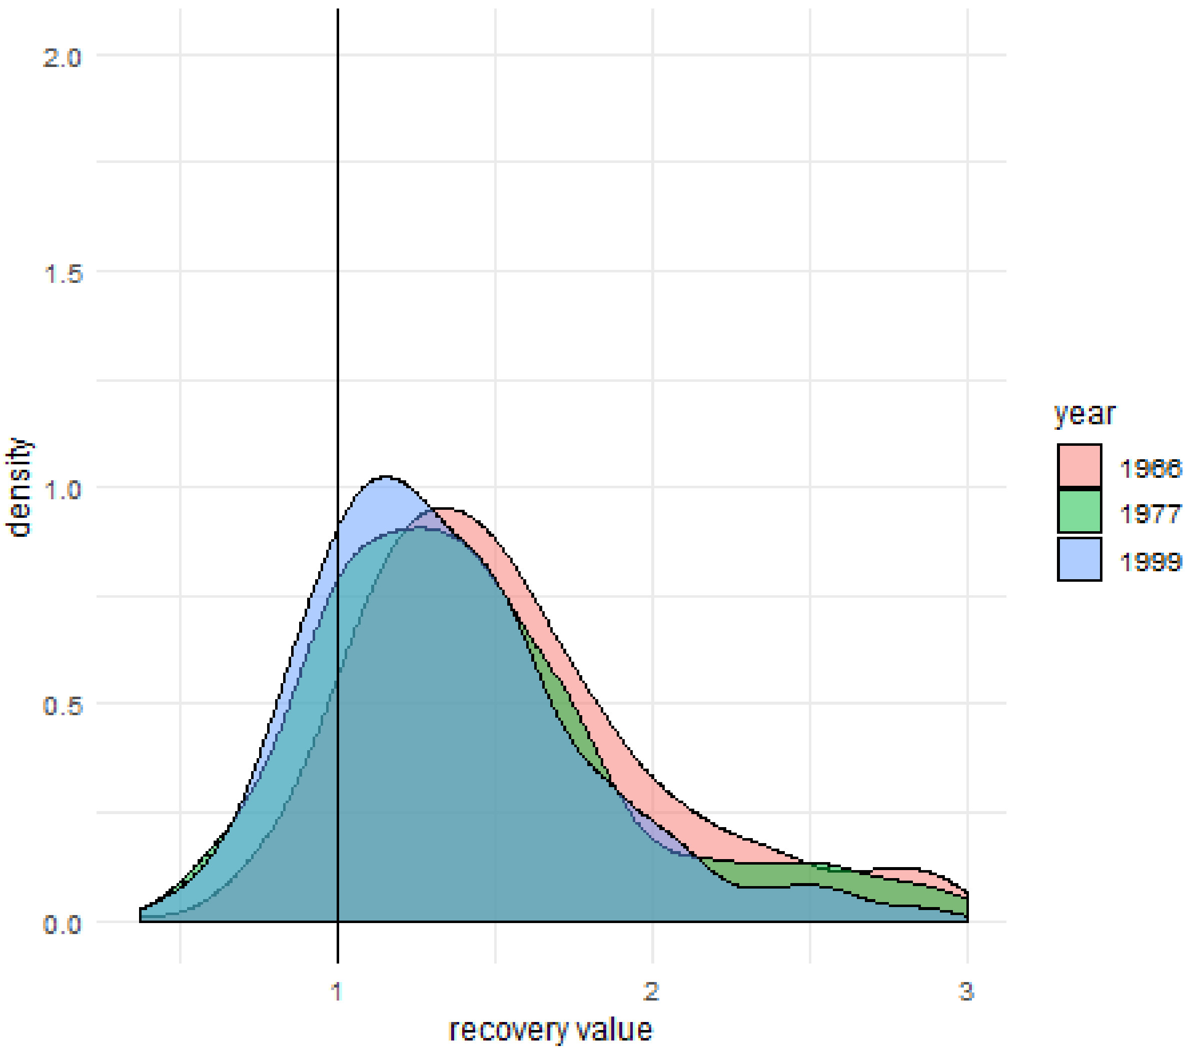

Figure S6. Density plot of drought recovery (Rc) values for each focal drought year.

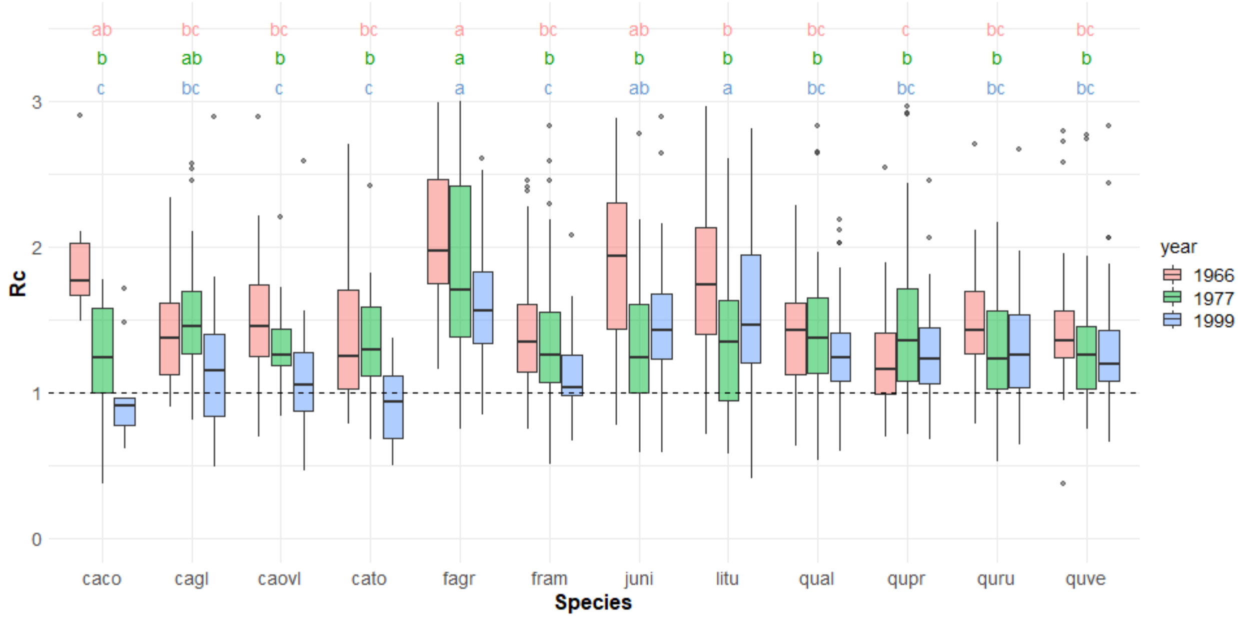

Figure S7. Drought recovery (Rc) across species for the three focal droughts. Species that are assigned the same letter are not significantly different from each other with regard to the tested variable. Letter groupings do not transfer between variables.

Methods S1. Further Package Citations

While there were several R-packages we used for a specific purpose in our methods, numerous packages were immensely helpful for this research behind the scenes. R-packages not already cited in the main manuscript include the following, listed alphabetically by corresponding package name:

R base (R Core Team 2019); broom (Robinson and Hayes 2020); car (Fox, Weisberg, and Price 2019); cowplot (Wilke 2019); data.table (Dowle and Srinivasan 2019); devtools (Wickham, Hester, and Chang 2020); dplR (Bunn et al. 2019); dplyr (Wickham, François, et al. 2020); extrafont (Winston Chang 2014); ggplot2 (Wickham, Chang, et al. 2019); ggpubr (Kassambara 2020); ggthemes (Arnold 2019); gridExtra (Auguie 2017); knitr (Xie 2020); lubridate (Spinu, Grolemund, and Wickham 2018); MuMIn (Barton 2019); piecewiseSEM (Lefcheck, Byrnes, and Grace 2019); png (Urbanek 2013); purrr (Henry and Wickham 2019); raster (Hijmans 2020); rasterVis (Perpinan Lamigueiro and Hijmans 2019); RCurl (Temple Lang 2020); readxl (Wickham and Bryan 2019); reshape2 (Wickham 2017); rgdal (Bivand, Keitt, and Rowlingson 2019); rgeos (Bivand and Rundel 2019); rmarkdown (Allaire et al. 2020); sf (Pebesma 2020); stringi (Gagolewski et al. 2020); stringr (Wickham 2019); tidyr (Wickham and Henry 2020)
