Supplementary Information

Tree height and leaf drought tolerance traits shape growth responses across droughts in a temperate broadleaf forest

Table S1. Monthly Palmer Drought Severity Index (PDSI), and its rank among all years between 1950 and 2009 (driest=1), for focal droughts.

year	month	PDSI	rank
1966	May	-2.98	2
	June	-3.40	2
	July	-4.08	2
	August	-4.82	1
1977	May	-2.96	3
	June	-3.28	3
	July	-3.61	3
	August	-3.68	3
1999	May	-3.63	1
	June	-4.21	1
	July	-4.53	1
	August	-4.64	2

Table S2. Species-specific regression equations for bark thickness (mm) as a function of diameter at breast height without bark (mm).

Species	Equations	R^2
Carya cordiformis	$ln[r_{bark}] = -1.56 + 0.416 * ln[DBH]$	0.226
Carya glabra	$ln[r_{bark}] = -0.393 + 0.268 * ln[DBH]$	0.04
Carya ovalis	$ln[r_{bark}] = -2.18 + 0.651 * ln[DBH]$	0.389
Carya tomentosa	$ln[r_{bark}] = -0.477 + 0.301 * ln[DBH]$	0.297
Fagus grandifolia	-	-
Fraxinus americana	$ln[r_{bark}] = 0.418 + 0.268 * ln[DBH]$	0.256
Juglans nigra	$ln[r_{bark}] = 0.346 + 0.279 * ln[DBH]$	0.246
Liriodendron tulipifera	$ln[r_{bark}] = -1.14 + 0.463 * ln[DBH]$	0.545
Quercus alba	$ln[r_{bark}] = -2.09 + 0.637 * ln[DBH]$	0.603
Quercus prinus	$ln[r_{bark}] = -1.31 + 0.528 * ln[DBH]$	0.577
Quercus rubra	$ln[r_{bark}] = -0.593 + 0.292 * ln[DBH]$	0.101
Quercus velutina	$ln[r_{bark}] = 0.245 + 0.219 * ln[DBH]$	0.087

We used linear regression on log-transformed data to relate r_{bark} to the diameter inside bark from 2008 data. These were then used to determine r_{bark} in the DBH_Y reconstruction (DBH in year Y). No bark correction was applied for *Fagus grandifolia*, which has thin bark.

Table S3. Species-specific regression equations for height (m) as a function of DBH (cm)

Species	Equations	R^2
Carya cordiformis	ln[H] = 0.332+0.808*ln[DBH]	0.874
Carya glabra	ln[H] = 0.685+0.691*ln[DBH]	0.841
Carya ovalis	ln[H] = 0.533+0.741*ln[DBH]	0.924
Carya tomentosa	ln[H] = 0.726+0.713*ln[DBH]	0.897
Fagus grandifolia	ln[H] = 0.708+0.662*ln[DBH]	0.857
Liriodendron tulipifera	ln[H] = 1.33+0.52*ln[DBH]	0.771
Quercus alba	ln[H] = 0.74+0.645*ln[DBH]	0.719
Quercus prinus	ln[H] = 0.41+0.757*ln[DBH]	0.886
Quercus rubra	ln[H] = 1.00+0.574*ln[DBH]	0.755
all	ln[H] = 0.839+0.642*ln[DBH]	0.857

Table S4. Individual tests of species traits as drivers of drought resistance, where Rt is used as the response variable.

		all droughts		1966		1977		1999	
variable	category	ΔAICc	coefficients	ΔAICc	coefficients	ΔAICc	coefficients	ΔAICc	coefficients

Models are ranked by AICc. Shown are all models whose AICc value falls within 2.0 (ΔAICc<1) of the best model (bold). R^2 refers to conditional R^2. Year was included in the model for all drought years and appeared in all its top models (1966: 0, 1977: -0.099, -0.099, -0.099, -0.097, -0.097; 1999: -0.174, -0.174, -0.174, -0.173, -0.172).

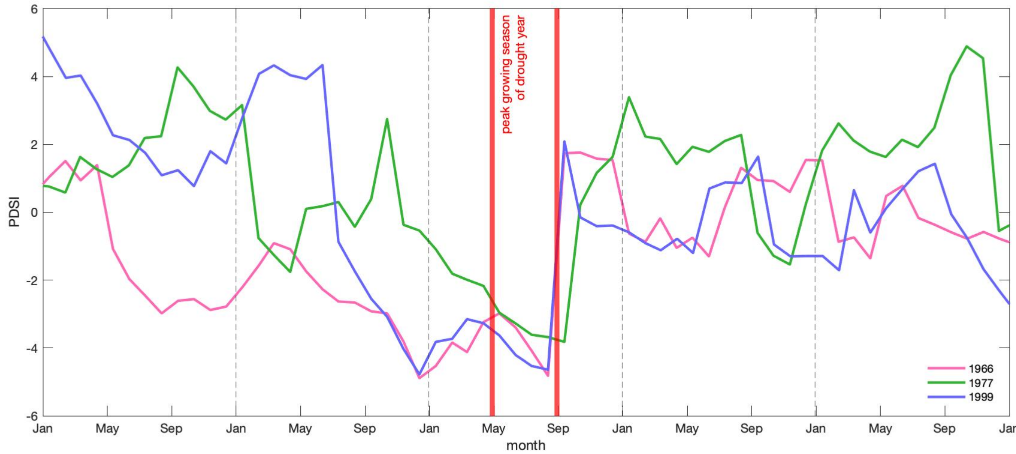

Figure S1. Time series of Palmer Drought Severity Index (PDSI) for each focal drought year ± 2 years

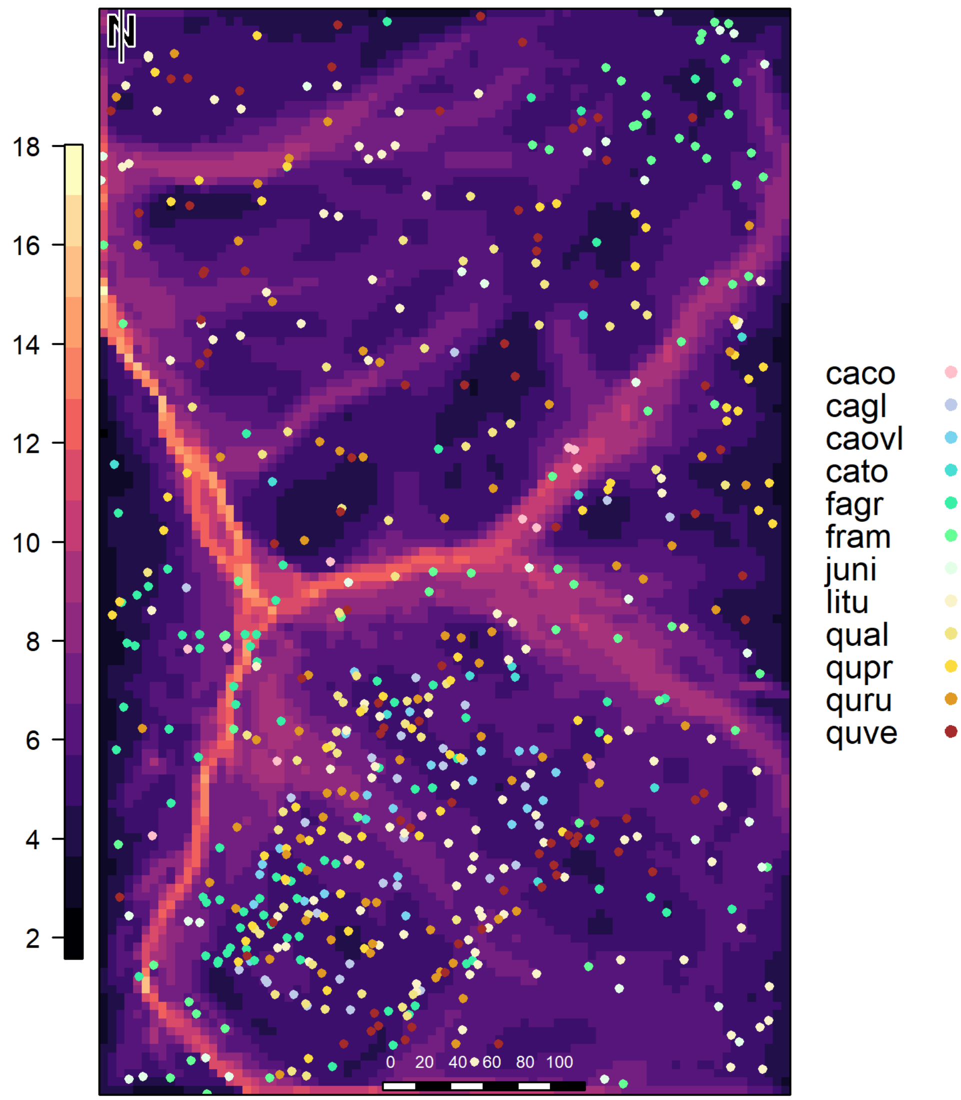

Figure S2. Map of ForestGEO plot showing topographic wetness index (color scale) and location of cored trees. Scale units are in meters

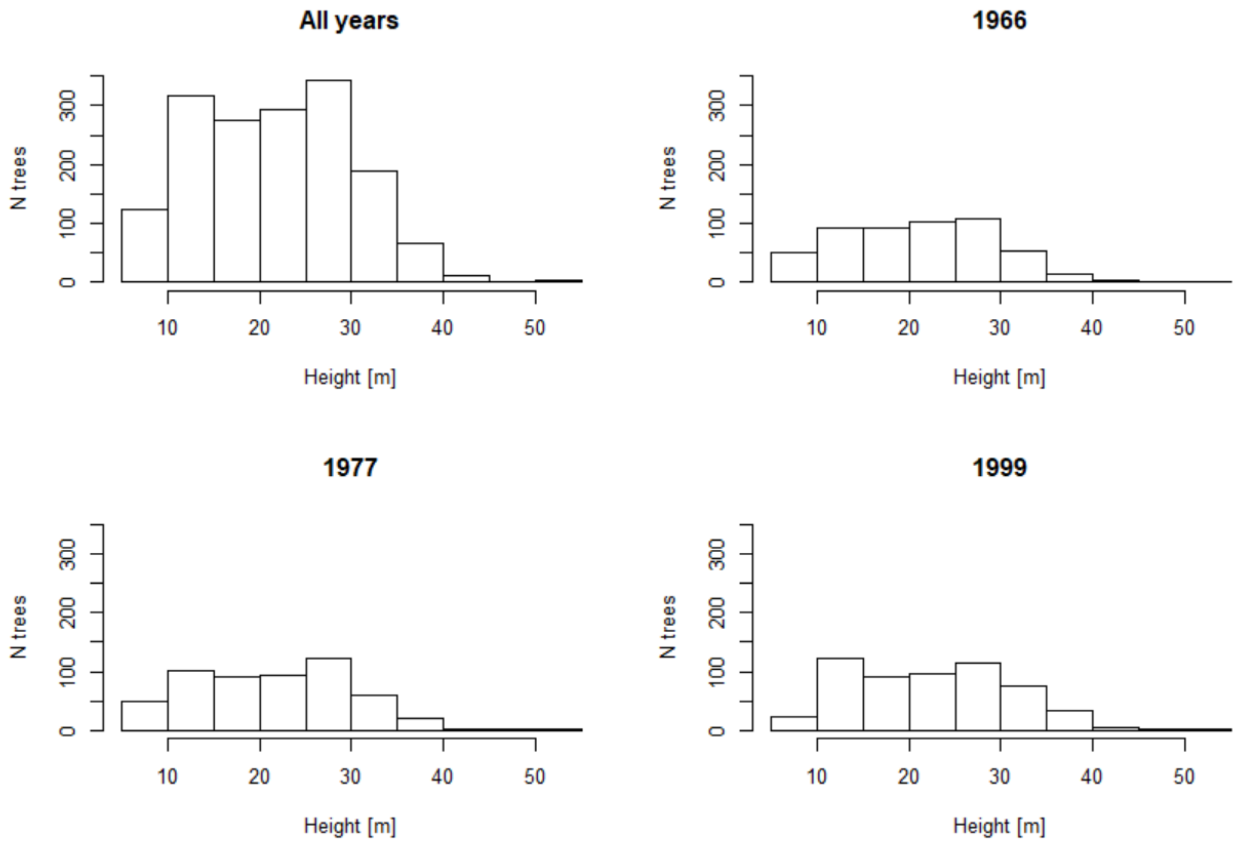

Figure S3. Distribution of reconstructed tree heights across drought years.

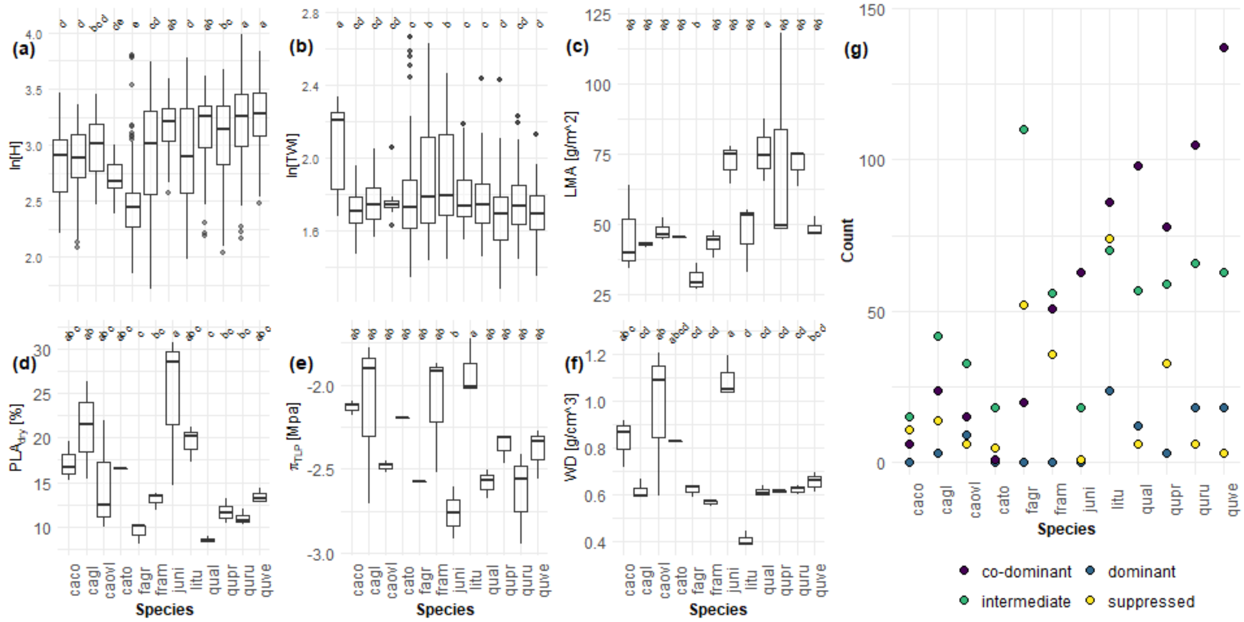

Figure S4. Distribution of independent variables by species. Species that are assigned the same letter are not significantly different from each other with regard to the tested variable. Letter groupings do not transfer between variables.

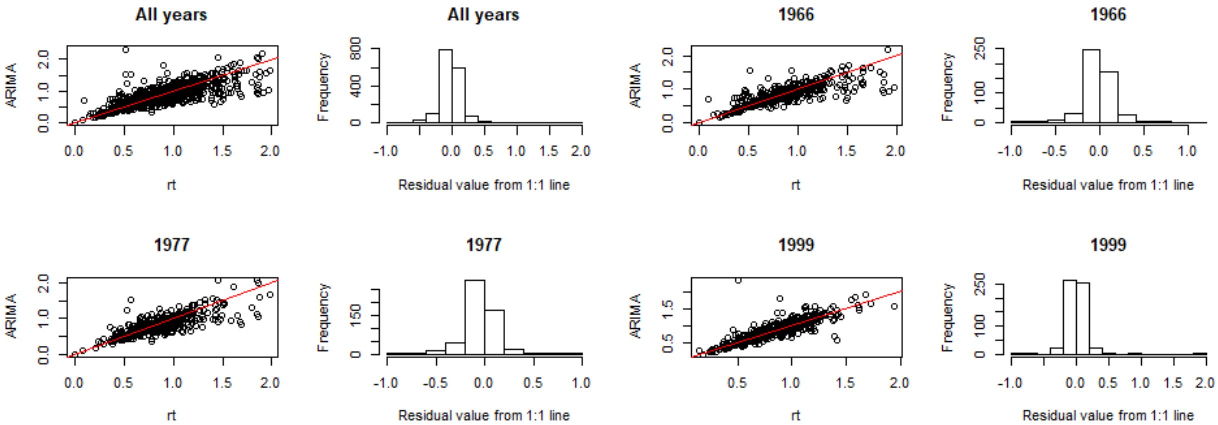

Figure S5. Comparison of Rt and Rt_{ARIMA} results, with residuals, for each drought scenario

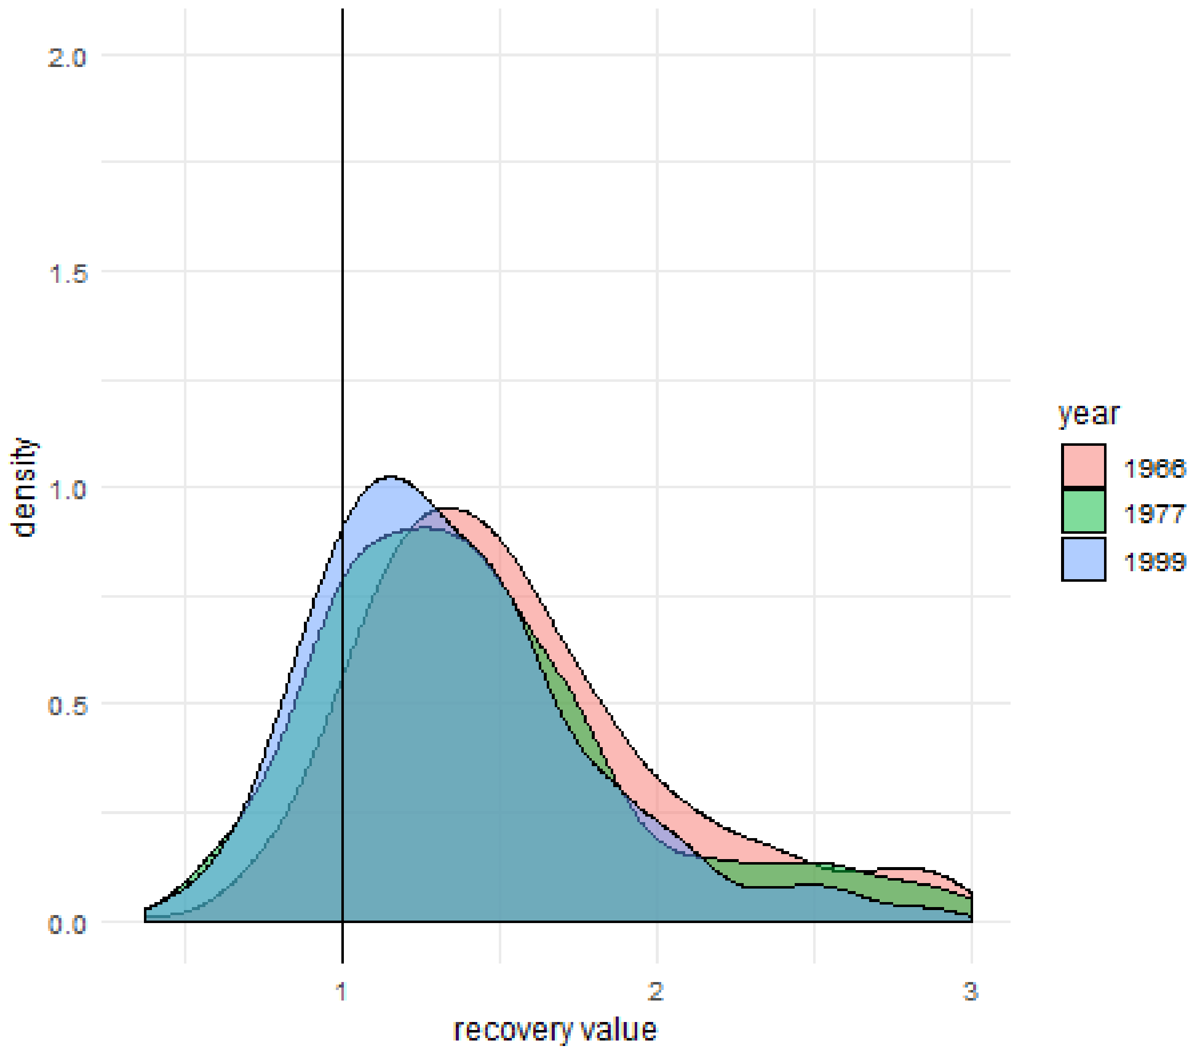

Figure S6. Drought recovery, Rc, across species for the three focal droughts.

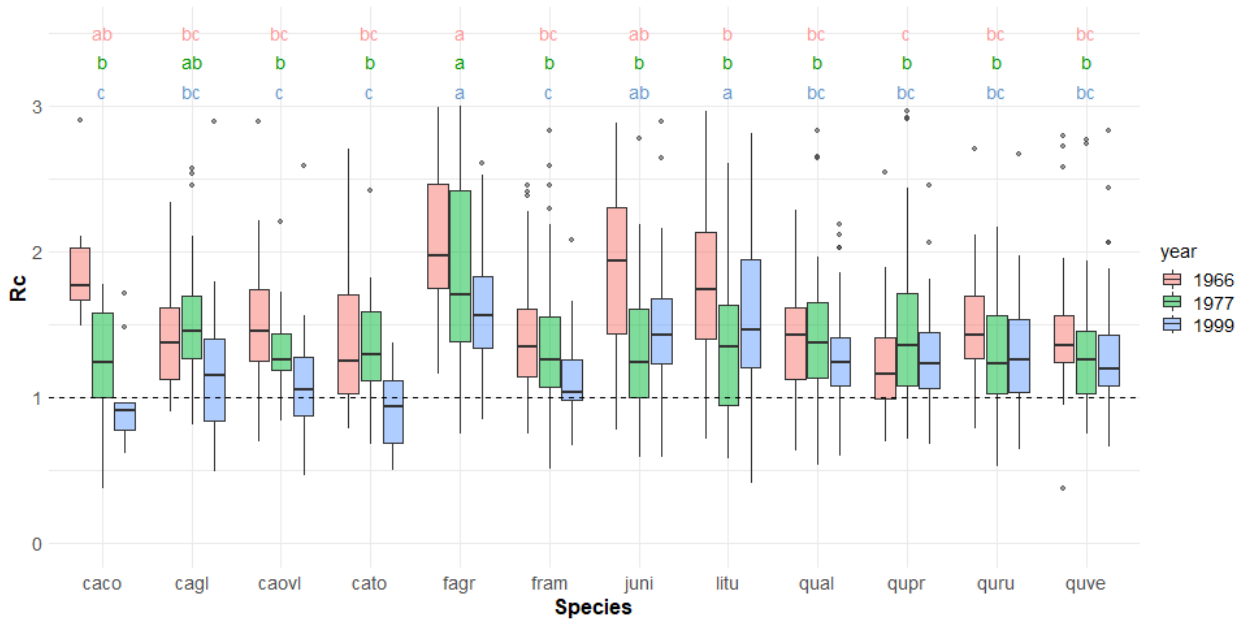

Figure S7. Drought recovery, Rc, across species for the three focal droughts.

Appendix S1. Further Package Citations

While there were several R-packages we used for a specific purpose in our methods, numerous packages were immensely helpful for this research behind the scenes. As in all of science, this study is a representation of the work done by both the authors of this paper as well as countless others. While acknowledging everyone is impossible, we want to at least give thanks to those who made this work possible.

R-packages not already cited in the main manuscript include the following, listed alphabetically by corresponding package name:

R base (R Core Team, 2019); broom (Robinson & Hayes, 2020); car (Fox *et al.*, 2019); cowplot (Wilke, 2019); data.table (Dowle & Srinivasan, 2019); devtools (Wickham *et al.*, 2020b); dplR (Bunn *et al.*, 2019); dplyr (Wickham *et al.*, 2020a); extrafont (Winston Chang, 2014); ggplot2 (Wickham *et al.*, 2019); ggpubr (Kassambara, 2020); ggthemes (Arnold, 2019); gridExtra (Auguie, 2017); knitr (Xie, 2020); lubridate (Spinu *et al.*, 2018); MuMIn (Barton, 2019); piecewiseSEM (Lefcheck *et al.*, 2019); png (Urbanek, 2013); purrr (Henry & Wickham, 2019); raster (Hijmans, 2020); rasterVis (Perpinan Lamigueiro & Hijmans, 2019); RCurl (Temple Lang, 2020); readxl (Wickham & Bryan, 2019); reshape2 (Wickham, 2017); rgdal (Bivand *et al.*, 2019); rgeos (Bivand & Rundel, 2019); rmarkdown (Allaire *et al.*, 2020); sf (Pebesma, 2020); stringi (Gagolewski *et al.*, 2020); stringr (Wickham, 2019); tidyr (Wickham & Henry, 2020)
